

# LASER-ART STRUCTURES by BRANCHLINE TRAINS

**3A)** The rear entry alcove is constructed by first gluing the roof #1 and the floor #2 to the two entry walls #3 and #4. This assembly can then be glued to the rear alcove wall #5.

Now build up the two doors by applying the door trim panel to the rear door panel with its peel-and-stick backing. Now install the door frame, then press the door into place in its opening as shown.

**3B)** Now glue the completed alcove onto place in the slotted holes on the main back wall as shown. Once it is in place and dry, add the inner and rear trim pieces as shown.

Build up the side entry door as you did the rear entry door and install as shown.

**Front entry alcove:**

**4A)** Start assembly of the front entry alcove by adding the clear glazing to the two side lights and then installing these onto the outer door trim as shown. Next, add the front door trim panel to the door back, then mount that assembly to the alcove back wall.

Now glue the side walls 3 and 4 to the ceiling and floor 1 and 2, then insert and glue this assembly into the back wall 5 as shown.

**4B)** The completed alcove can now be glued into place behind the front wall. Note that the flooring overlaps the bottom of the wall opening. To finish the alcove, add the peel and stick trim piece around the opening.
