

4c

4c) We have provided interior framing to be used if you're modeling the garage with the doors open. Glue the framing into place starting with the rear wall. These parts are fragile and care should be taken when handling them. The framing can be left in natural wood color or painted if desired.

5

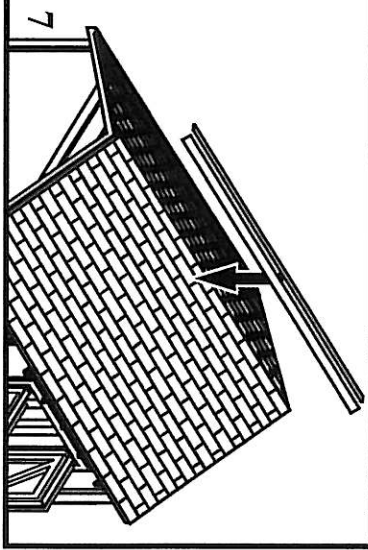

Trim:
5) There are 8 pieces of peel-and-stick trim for the corners of the garage. The front and rear corner trim overlaps the side corner trim to make a tight corner. Now apply the two peaked trim sections to the front and rear edges of the roof. The final piece of trim goes around the door opening.

6

Shingles:
6) We have provided pre-cut plastic roofing shingles with peel-and-stick backing. Simply peel the backing off the four shingle sections and place them on the sub-roof joining them at the peaks.

If you have modeled open doors they can now be added by gluing the extended lip of each door to the door posts as shown.

7

7) You will find a strip of white plastic strip to be used to represent roof peak trim. These need to be cut to fit as shown and glued onto the roofing shingles using liquid plastic cement. It is easiest to cut each section slightly longer than needed, trimming them flush with the roof edges after the glue has dried.

The roof can be painted dark grey, brown, dull green or dull red. This can be followed with a black wash and dry-brushed highlights for added texture.

Your kit is now completed and ready for your layout. We hope you've enjoyed this kit. If you have any problems or comments, please contact us at:
