

**Constructing the shell:**

1A) Start reconstruction of the main building walls by gluing the rear wall and the smaller inner front wall to the two side walls as shown.

1B) Now glue the second story front wall into place using the tabs on each side to locate it.

1C) Glue the two entry side wall pieces and ceiling together as shown. Glue the completed entry into the slots on the front of the inner front wall.

If you have not done so already, paint the inner front wall where it will be seen through the picture windows later.

1D) Glue the outer front wall into place as shown.

1E) Assemble the two entryway columns by first gluing the two sections together (make sure the tabs are positioned properly) then gluing the completed column into the slots in the inner front wall.

**Building the facade:**

2A) To assemble the entryway doors first remove the peel-and-stick backing from the outer door panels and stick them to the faces of the rear panels. Next, remove the backing from the door frame and press each door into the frame making sure it is centered and flush with the bottom edge. The completed doors can now be placed in the openings in the front of the building. Make sure the wider sides of the two outer door frames are facing to the outside, away from the center door.
