

Windows and doors:

4A) Assemble the rear section's doors by removing the backing from the front door panel and pressing it onto the face of the rear panel. The door can then be pressed onto the back of the frame and put into place - the peel-and-stick adhesive on the door frame will be more than enough to hold the door into the opening

4B) Assemble the side door by removing the backing from the door and applying the clear glazing piece onto the back of it. Apply the completed assembly to the back of the door frame and press the completed side door into place.

Assemble the windows by removing the backing from each window frame and applying the glazing piece to the back of it. Apply the two small sliding windows to the back of the main serving window as shown. Once assembled, you can press the window assembly into the frame, making sure it is centered. The whole unit can then be placed into the opening in the front of the stand.

Fence and gate:

5) Remove the backing from the two sections of the fence with gate and apply to each other back to back so that you end up with detail on both sides. Glue the completed fence into the slots on the front and rear walls of the main structure as shown.

Deck:

6A) Paint or stain the deck before installing it.

Glue the completed building into the slots on the deck. The platform can be painted prior to attaching the depot. This will give you an outer platform in front of the stand as well as a floor on the inside.
