

LASER-ART STRUCTURES by BRANCHLINE TRAINS

4C) Glue the long rear beam into place to complete the framework.

Trim:

5) Apply the inner scribed siding as you did on the ramp section, then add the outer trim panels as shown. These will overlap slightly at the corners for a neat finished appearance.

Decking:

6) Now add the top decking as you did the decking on the ramp section. This should line up evenly on all four sides. Remove the backing and press it into place. The platform will fold down at the ramp. This should be easy to bend at one of the scribed boards.

Rear stairs:

7) Glue on the two stair stringers into the slots in the end of the platform. Once dry, add the treads by removing the backing from them and press them onto the tops of the stringers.

Final Assembly:

The ramp section can be installed to the main platform if desired, but can also be used independently. If using this platform with our station, it can then be installed at the baggage room end as shown.

We hope you've enjoyed this kit. If you have any problems or comments, please contact us at:
