

LASER-ART STRUCTURES by BRANCHLINE TRAINS

Constructing the shell:

1) Start construction of the main building walls by gluing the side walls to the front and rear walls as shown. Now add the two upper side walls.

Coal Bin Floor:

2) Using white glue, glue in the five floor supports into the slots on the two side walls making sure that the scribing on the side walls is facing inwards. Add the bin floors into the V shaped area making sure the scribing is facing down. Slide the completed assembly into the bottom of the structure. The top edges of the bins should sit up against the lower edge of the upper wall sections (didn't follow that? See the diagram...!).

Coal doors:

3) There are 5 coal doors on the front of the structure - three small and two large ones. Apply the front trim of the doors to the back panels using the peel-and-stick adhesive to hold them in place. Now remove the peel-and-stick backing from the back panels and press them onto the front wall just above the openings in the wall as shown.
